

Project Demonstration

Demonstration of Proposed Features

Date: 10 July 2026

Team ID: SWTID-2026-6119

Project Name: Credit Card Approval Prediction System

Maximum Marks: 4 Marks

This document is the live demo script - every feature that will be shown to evaluators, in order, with the exact steps to demonstrate it and the expected outcome.

#	Feature	Demo Steps	Expected Outcome
1	Application Form UI	Open http://127.0.0.1:5000 in a browser	Banking-themed form loads with all applicant fields (personal, financial, employment)
2	Input Validation	Submit the form with one required field left empty	Form redisplayes with a clear 'Missing required field' error - no crash
3	Live Prediction - Approved case	Fill in a strong applicant profile (high income, employed, no prior default) and submit	Result page shows 'Approved' with a high confidence score
4	Live Prediction - Rejected case	Fill in a weaker applicant profile and submit	Result page shows 'Rejected' with the model's confidence score
5	Custom 404 Page	Navigate to a non-existent URL on the running app	On-brand custom 404 page appears instead of a generic server error
6	Model Training & Comparison	Open <code>EDA_and_Model_Training.ipynb</code> and show the executed comparison table	Table showing Accuracy/Precision/Recall/F1 for all 4 models, with XGBoost highlighted as best
7	EDA Visualizations	Show the class balance, correlation heatmap, and confusion matrix charts in the notebook	Charts render correctly, supporting the preprocessing and model-selection decisions
8	GitHub Repository Walkthrough	Open the public repo and browse the 8 numbered phase folders	Evaluator sees a complete, professionally organized project from Ideation through Demonstration

Total features demonstrated: 8, covering the full pipeline from raw data to a live, working prediction in the browser.
